

# Carbon Capture And Geological Storage An Overview

**Presenter: Rick Causebrook** – General Manager Research  
Australian Low Emissions Coal Research & Development

CHINA-AUSTRALIA GEOLOGICAL STORAGE

CAGS II Training School  
14<sup>th</sup> – 17<sup>th</sup> May 2014- Nanjing

2

## Key Messages

1. Evidence from petroleum studies show that oil, gas and CO<sub>2</sub> can be stored in the deep subsurface for geological time
2. CO<sub>2</sub> can be stored in depleted oil and gas fields and deep saline formations
3. CO<sub>2</sub> injected as a fluid into reservoirs (sandstones) is trapped by seals (mudstones)
4. The technology for the geological storage of CO<sub>2</sub> is mature

CAGS Training School 2  
Nanjing 14 – 17 May 2014

## Public Acceptance

The major obstacle to the uptake of CCS is the community's **lack of understanding** of the technology.

CAGS Training School 2  
Nanjing 14 – 17 May 2014

## What is Carbon Capture and Storage?

- Capture from stationary source – e.g Power plant
- Transport to a storage site (pipeline)
- Injection via a well bore into a deep geological formation as a supercritical fluid
- Monitoring the migration of the fluid under buoyancy away from the injection point
- Eventual permanent trapping - structural, dissolution, residual and geochemical

CAGS Training School 2  
Nanjing 14 – 17 May 2014

5

## Large Scale CO<sub>2</sub> Emission Sources

- **CO<sub>2</sub> can be captured from a variety of sources**
- Power Generation
- Gas Processing
- Cement Manufacturing
- Iron and Steel Production
- Fertiliser manufacture
- Hydrogen Production
- Chemical Refining

CAGS Training School 2  
Nanjing 14 – 17 May 2014

6

## Three CO<sub>2</sub> Capture Routes in Power

Post-combustion  
CO<sub>2</sub> capture

- Fossil fuel or biomass is burnt normally and CO<sub>2</sub> is separated from the exhaust gas

Pre-combustion  
CO<sub>2</sub> capture

- Fossil fuel or biomass is converted to a mixture of hydrogen and CO<sub>2</sub>, from which the CO<sub>2</sub> is separated and hydrogen used for fuel

Oxy-combustion  
CO<sub>2</sub> capture

- Oxygen is separated from air, and fossil fuels or biomass are then burnt in an atmosphere of oxygen producing only CO<sub>2</sub> and water

*At the present time, none of the options is superior; each has particular characteristics making it suitable in different power generation applications*

CAGS Training School 2  
Nanjing 14 – 17 May 2014

7

## CO<sub>2</sub> Transport Options

- 1) **Pipeline:** Good experience with pipeline transport in the USA. In 2010 US had 6,600 km of pipeline that moved over 60Mt of CO<sub>2</sub>
- 2) **Ship:** Transport of CO<sub>2</sub> by ship has been demonstrated at a small scale, however similar to LNG transport will require extensive infrastructure for loading and unloading
- 3) **Road or rail:** Small scale only – pilot and demonstration projects

CAGS Training School 2  
Nanjing 14 – 17 May 2014

## Options for Geological Storage

8

Source IPCC

9

## Why Supercritical CO<sub>2</sub>

- At Pressures higher than 7.39 MPa and Temperatures higher than 31.1°C, CO<sub>2</sub> becomes a supercritical fluid: gas like but with up to 400X the density.
- Generally these conditions are found below about 800m in the subsurface

CAGS Training School 2  
Nanjing 14 – 17 May 2014

10

## Sedimentary basins and geological storage

- Saline aquifers suitable for storage occur almost exclusively in sedimentary basins
- These are depressions in the crust of the earth in which sediments have accumulated over millions of years and which have not experienced significant uplift and folding
- They may be tens of kilometres thick and occur both on the continents and under shallow seas
- All oil and gas accumulations occur in sedimentary basins.

GSQ/GGSS Queensland Carbon Dioxide Geological Storage Atlas 2009.

CAGS Training School 2  
Nanjing 14 – 17 May 2014

11

## All Basins are not Equal

- Sedimentary basins are the regions that offer the opportunity for geological storage of CO<sub>2</sub>.
- But all sedimentary basins do not have the same potential for storage
- We need to consider the tectonic settings and reservoir characteristics of each basin when considering it for geological storage.

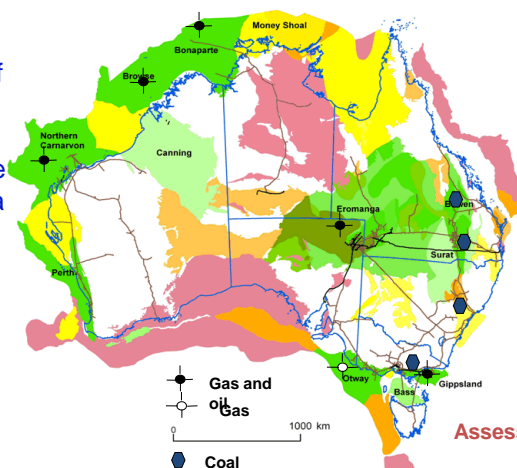

CAGS Training School 2  
Nanjing 14 – 17 May 2014

12

## Not all sedimentary basins are equal

An example of the ranking of basins for carbon dioxide storage from a recent Australian Government Study conducted by Geoscience Australia

**Assessed storage potential  
of Australian basins**  
National Mapping Carbon Mapping and  
infrastructure Plan 2009

CAGS Training School 2  
Nanjing 14 – 17 May 2014

13

## Reservoirs and Seals

- **Reservoir rocks** have spaces (pores) between the grains which can hold fluids and connections between the pores which can allow the fluids to flow through them (permeability). Sandstones and limestones
- **Sealing rocks** are very fine grained with not practical permeability. Mudstones or shales.

CAGS Training School 2  
Nanjing 14 – 17 May 2014

14

## Reservoir Rock Properties

- A "very good" storage reservoir might have porosity approaching 30%; a marginal reservoir could be in the single digits.
- However even with good porosity, if the interconnections between the pores are blocked permeability will be low and injection difficult

Pore space is blue and grains of quartz are white in this photograph of a microscopic cross-section of rock (courtesy of CO2CRC)

CAGS Training School 2  
Nanjing 14 – 17 May 2014

15

## Reservoirs and Seals

In the sub-surface, where a sealing rock overlies a porous reservoir rock the seal is able to prevent buoyant fluids such as oil gas or carbon dioxide from rising out of the reservoir.

This relationship can be seen in this coastal outcrop

CAGS Training School 2  
Nanjing 14 – 17 May 2014

16

## Trapping the carbon dioxide

- Structural/stratigraphic trapping

- Residual trapping

- Solubility trapping

- Mineral trapping

CAGS Training School 2  
Nanjing 14 – 17 May 2014

17

Structural trapping

Stratigraphic trapping

Nanjing 14 – 17 May 2014

18

Storage in Deep Aquifers

CAGS Training School 2  
Nanjing 14 – 17 May 2014

19

## Saline Reservoir Trapping

CO<sub>2</sub> Trapped in solution

CO<sub>2</sub> Trapped as a mineral

CO<sub>2</sub> Trapped in  
rock pores as  
Residual  
Saturation  
(S<sub>gr</sub>CO<sub>2</sub>)

All these processes are time dependant. That is the proportion of the carbon dioxide trapped and thus the security of trapping increases over time and the length of the migration path

CAGS Training School 2  
Nanjing 14 – 17 May 2014

20

## Saline Reservoir Trapping

Storage in saline reservoirs will also take place in **sub-seismic** structural and stratigraphic closures both at the base of the seal and with the body of the reservoir.

Trapping may occur under thin intrabed shales like these which are below seismic resolution before they trap the CO<sub>2</sub>.

Source IPCC

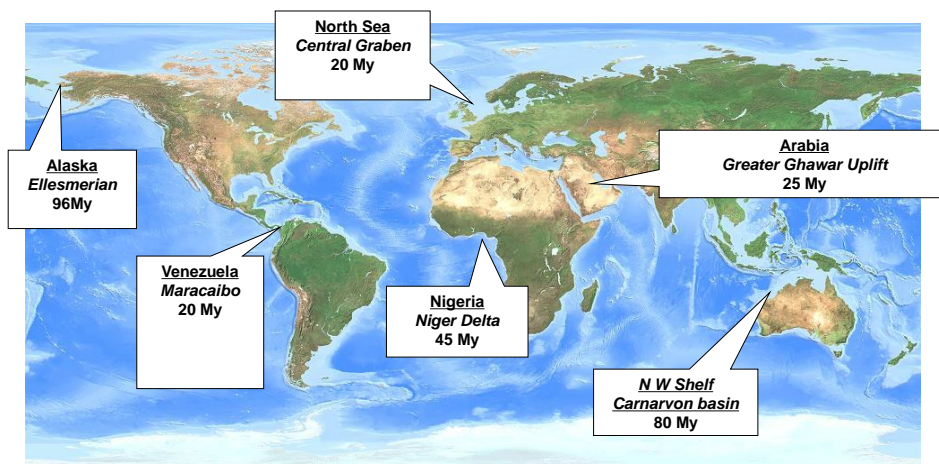

## How long will it stay there?

- Naturally occurring fluids have been trapped underground for many millions of years.
- Oil, natural gas and CO<sub>2</sub>.
- This can be shown by the study of petroleum systems.

CAGS Training School 2  
Nanjing 14 – 17 May 2014

## Timing Of Petroleum Charge Into Traps

CAGS Training School 2  
Nanjing 14 – 17 May 2014

## Is This New Or Unproven Technology?

- The critical components of the CCS process are currently in use within the Oil & Gas Industry.
- **Capture:** Natural gas processing, ammonia plants other industrial processes.
- **Transport:** 5650 km of CO<sub>2</sub> pipeline in the USA.
- **Injection:** EOR – 70 projects in West Texas. Acid gas disposal
- **Storage:** Subsurface storage of natural gas for 100yrs. Deliberate storage of CO<sub>2</sub> since mid 1990s
- **CO<sub>2</sub> storage in the North Sea since 1996**

Source IPCC

26

## Examples of deep saline aquifer storage projects

- **Sleipner**- Statoil has been injecting CO<sub>2</sub> into an aquifer in the North Sea since 1996
  - More than 17 Mt CO<sub>2</sub>
- **Snovit** – Statoil has been reinjecting CO<sub>2</sub> into a saline aquifer in the Barents Seasince 2008.
  - Approximately 1.9Mt injected
- **In Salah**- BP, Sonatrach, and Statoil injected CO<sub>2</sub> into the water leg of a gas bearing formation in Algeria between 2004 and 2012
  - Approximately 1.2 Mt CO<sub>2</sub> per year

CAGS Training School 2  
Nanjing 14 – 17 May 2014

anlecr&d

## Boundary Dam – Saskatchewan, Canada First Commercial CCS from a Coal fired Power station

**Saskpower Boundary Dam 3 Unit** has been rebuilt with an integral carbon capture facility which will capture up to 1 million tonnes CO<sub>2</sub>/year.

The captured gas will be used for EOR in the nearby oil fields and the excess will be injected in a saline aquifer as part of the Aquistore Project

Start-up previously expected in April 2014 but this now put back due to delays in the power unit upgrade

## The Gorgon Project Largest CCS Project planned to commence in 2015

**Project Operator:**  
**Chevron Australia**

Gas piped and separated on Barrow Island  
CO<sub>2</sub> removed for sales gas  
CO<sub>2</sub> compression attached to gas facility  
Up to 3.4Mtpa of CO<sub>2</sub> will be captured, piped and stored in deep formations below Barrow Island

**The Greater Gorgon Gas Fields** lie 130-200km offshore and contain about 40 trillion cubic feet of gas  
Water depths, Gorgon 270m Janz 1300m  
CO<sub>2</sub> content Gorgon 14%, Janz 0% , overall ~7%  
Processing Facility onshore Barrow Island 3x5Mtpa trains.

29

## In Conclusion (1):

- CCS is not the silver bullet to fix all our problems. It is part of a solution, together with developing renewable and efficient energy options.
- Petroleum studies show that oil, gas and CO<sub>2</sub> can be stored in the deep subsurface for geological time (millions of years).
- CO<sub>2</sub> is injected as a fluid into tiny spaces between grains in reservoirs (sandstones) and is trapped by seals (mudstones).
- The technology for the geological storage of CO<sub>2</sub> is mature and geological storage of CO<sub>2</sub> is already happening.

CAGS Training School 2  
Nanjing 14 – 17 May 2014

30

## In Conclusion (2)

The major barrier to the uptake of CCS is the community's **lack of understanding** of the technology.

CAGS Training School 2  
Nanjing 14 – 17 May 2014
